Course Code: MIT 8212
Institution: Miva Open University
Date: [Insert Date]

Abstract (150–200 words)

This study explores the collaboration between IT managers and clinicians in implementing electronic medical record (EMR) systems in hospitals. It identifies common barriers such as clinician resistance, inadequate training, and misaligned expectations. Drawing on case studies from Nigerian hospitals and global literature, this paper examines strategies to enhance collaboration, including change management frameworks, joint training, and cross-functional project teams. Findings suggest that trust, communication, and co-design of IT systems with end-users are critical success factors. The study concludes with recommendations for IT managers on stakeholder engagement and reflective lessons for future healthcare IT projects.

1. **Introduction**

- Background to health IT adoption.
- The promise of EMRs for efficiency, accuracy, and patient safety.
- Problem statement: High resistance among clinicians toward EMR adoption.
- Research Question: How can IT managers and clinicians collaborate effectively to ensure successful EMR adoption in hospitals?
- Relevance: Implications for healthcare management in Nigeria and globally.

2. **Literature and Industry Review**

- Global trends in hospital IT adoption.
- Success and failure case studies (e.g., EMR rollout in the US, Kenya, Nigeria).
- Common barriers: lack of user involvement, cost, complexity, and workflow disruption.
- Theoretical lens: Technology Acceptance Model (TAM) and Change Management Theory.

3. **Investigative Approach**

- Method: Case study review + secondary data analysis (academic articles, WHO reports, Nigerian hospital studies).
- Tools: SWOT analysis to evaluate collaboration strengths and weaknesses.
- Comparative review: Two hospitals (one with successful EMR adoption vs. one with failed adoption).

4. Findings/Analysis

- Key Findings:

1. Early involvement of clinicians reduces resistance.
2. Training and co-design workshops improve acceptance.
3. Cross-functional teams (IT + clinical staff) ensure better system fit with workflows.

- Example case: A teaching hospital in Lagos achieved higher EMR adoption through clinician-led pilot testing.

5. Conclusions and Recommendations

- **Conclusions:** Collaboration is a critical factor in IT success in healthcare; resistance often stems from poor communication and lack of trust.
- **Recommendations:**

1. Establish joint IT–clinical committees for system rollouts.
2. Provide continuous training and technical support.
3. Apply reflective learning logs to capture lessons after each IT project stage.
4. Scale pilots gradually before full adoption.

How To Use This Template

1. Replace the **topic and sector** with their chosen one.
2. Follow the **five-chapter flow** (Intro - Literature - Approach - Findings - Conclusion).
3. Include **case study examples** from the chosen industry.
4. Use **APA citations** and ensure the paper is **20–25 pages.**
